Department of Computer Science & Engineering

Student Name: Shreyansh Gupta

UID:24BAI70658

Branch: Computer Science & Engineering (AIML)

Section/Group:24AIT-KRG-1/G2

Semester:4th

Subject Name: DBMS

Experiment 10 – Design of Trigger for Automatic Primary Key Generation (Enterprise Application)

Designing and implementing a database trigger that automatically generates and enforces unique primary key values during record insertion. This experiment demonstrates automation, data integrity, and elimination of manual errors in enterprise database systems.

Aim

To create and implement a database trigger that automatically generates a unique primary key for each record inserted into a table.

Objective

- To understand the concept and working of database triggers
- To implement automatic primary key generation using triggers
- To eliminate manual intervention in key assignment
- To ensure uniqueness and data integrity
- To apply trigger-based automation in enterprise systems

Software Requirements

Database Management System:

- Oracle Database Express Edition (Oracle XE) / PostgreSQL

Database Administration Tool:

- Oracle SQL Developer / pgAdmin

Problem Statement

In enterprise-level applications, manually assigning primary keys can lead to duplication and errors. To maintain data integrity and ensure uniqueness, a trigger-based mechanism is required that automatically generates a primary key before inserting records into a table.

Apex Institute of Technology

Department of Computer Science & Engineering

Practical / Experiment Steps

- Create a table requiring automatic primary key generation
- Create a sequence to generate unique values
- Design a trigger that activates before insert
- Assign the next sequence value to the primary key
- Insert multiple records to test the trigger
- Verify uniqueness of generated keys

Procedure

- Open Oracle SQL Developer and connect to the database
- Create the required table
- Create a sequence for primary key generation
- Create a trigger using BEFORE INSERT event
- Compile the trigger successfully
- Insert records without specifying the primary key
- Display the table contents

Input / Output Details

Input

Table: employee (emp_id, name, salary)

SQL Implementation Overview

- Table creation
- Sequence creation
- Trigger creation
- Data insertion
- Result verification

Apex Institute of Technology

Department of Computer Science & Engineering

Output

After executing the program, each record is automatically assigned a unique primary key without manual input.

Example Output:

1 Aman 40000
2 Neha 50000
3 Rahul 45000
4 Simran 55000

Learning Outcome

After completing this experiment, the learner will be able to:

- Understand the working of database triggers
- Implement automatic primary key generation
- Ensure data integrity without manual intervention
- Apply trigger-based solutions in enterprise applications
- Develop efficient and reliable database systems
